87 Executive Summary

executive-summary

 $_{88}$ ${
m Stock}$

This assessment reports the status of the Pacific ocean perch (Sebastes alutus) speciess off rockfish off the U.S. West Coast from Northern California to the Canadian Border using data through 2017. Pacific ocean perch are most abundant in the Gulf of Alaska and have observed off of Japan, in the Bering Sea, and south to Baja California, although they are sparse south of Oregon and rare in southern California. Composition data indicate that good recruitment years coincide in Oregon and Washington. To date, no significant genetic differences have been found in the range covered by this assessment.

96 Landings

landings

The first year that harvest of Pacific ocean perch exceeded 1 mt off the U.S. West Coast first occured in 1929. Catches ramped up in the 1940s with large removals in Washington waters. During the 1950s the removals primarly occured in Oregon waters with catches from Washington declining following the 1940s. The largest removals in 1966-1968 were largely a result of harvest by foreing vessels. The fishery proceed with more moderate removals ranging between 1,200 to 2,600 metric tons per year between 1969 to 1980. Removals generally decined from 1981 to 1994 to between 1,000 and 1,700 metric tons per year. Pacific ocean perch was declared overfished in 1999 resulting in large reduction in harvest in recent years since the declaration.

Table a: Landings (mt) for the past 10 years for Pacific ocean perch by fleet.

Data and Assessment

108

109

110

112

data-and-assessment

This a new full assessment for Pacific ocean perch which was last assessed in 2011. In this assessment, all aspects of the model including catches, data, and modelling assumptions were re-evaluated as much as possible. The assessment was conducted using the length- and age-structured modeling software Stock Synthesis (version 3.30). The coastwide population was modeled assuming separate growth and mortality parameters for each sex (a two-sex model) from 1918 to 2017, and forecasted beyond 2017.

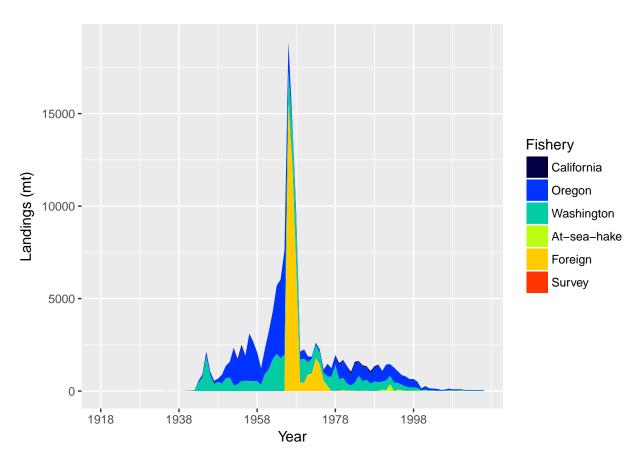

Figure a: Landings of Pacific ocean perch for California, Oregon, Washington, the Foriegn fishery (1966-1976), At-Sea Hake fishery, and fishery independent surveys.

 $_{ ext{113}}$ Stock Biomass $_{ ext{stock-biomass}}$

Include: trends and current levels relative to virgin or historic levels, description of uncertainty-include table for last 10 years and graph with long term estimates.

Spawning output Figure: Figure b Spawning output Table(s): Table b Relative depletion Figure: Figure c

Example text (remove Models 2 and 3 if not needed - if using, remove the # in-line comments!!!)

The estimated relative depletion level (spawning output relative to unfished spawning output)

of the base-case model in 2017 is 17.2% (~95% asymptotic interval: \pm -3.43%-37.9%)

(Figure c).

Table b: Recent trend in estimated spawning output (million eggs) and relative spawning output.

| 2015 | 0.147 | -0.019 - 0.313 | 0.003 | -0.001 - 0.006 |
| 2016 | 0.128 | -0.019 - 0.276 | 0.002 | -0.001 - 0.005 |

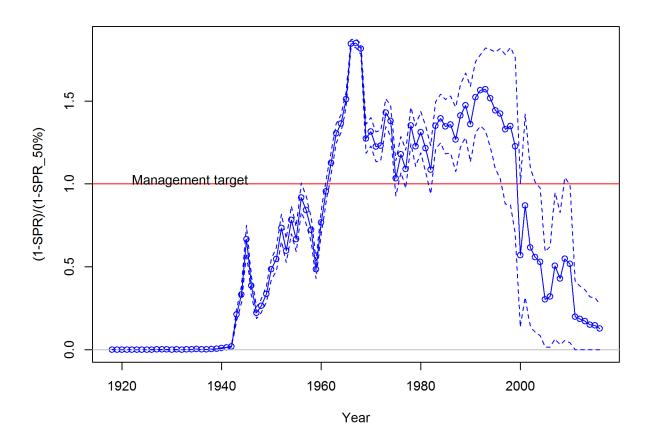

Figure e: Estimated spawning potential ratio (SPR) for the base-case model. One minus SPR is plotted so that higher exploitation rates occur on the upper portion of the y-axis. The management target is plotted as a red horizontal line and values above this reflect harvests in excess of the overfishing proxy based on the SPR $_{50\%}$ harvest rate. The last year in the time series is 2016.

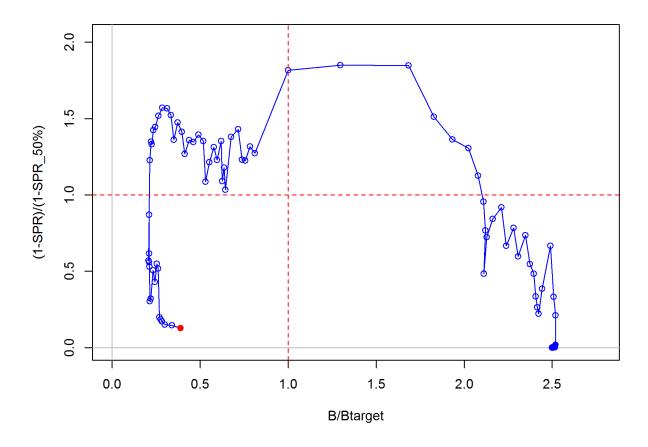

Figure f: Phase plot of estimated relative (1-SPR) vs. relative spawning biomass for the base case model. The relative (1-SPR) is (1-SPR) divided by 50% (the SPR target). Relative depletion is the annual spawning biomass divided by the unfished spawning biomass.

136 Ecosystem Considerations

ecosystem-considerations

In this assessment, ecosystem considerations were.....

138 Reference Points

reference-points

Include: management targets and definition of overfishing, including the harvest rate that brings the stock to equilibrium at $B_{40\%}$ (the B_{MSY} proxy) and the equilibrium stock size that results from fishing at the default harvest rate (the F_{MSY} proxy). Include a summary table that compares estimated reference points for SSB, SPR, Exploitation Rate and Yield based on SSBproxy for MSY, SPRproxy for MSY, and estimated MSY values

Write intro paragraph

This stock assessment estimates that Pacific ocean perch in the Base model are below the 145 biomass target, but below the minimum stock size threshold. Add sentence about spawning 146 output trend. The estimated relative depletion level for Model 1 in 2017 is 17.2% (~95%) 147 asymptotic interval: \pm -3.43%-37.9%, corresponding to an unfished spawning output of 955 148 million eggs (~95% asymptotic interval: -204.203617683797-2114.3436176838 million eggs) 140 of spawning output in the base model (Table e). Unfished age 3+ biomass was estimated 150 to be 119982 mt in the base case model. The target spawning output based on the biomass 151 target $(SB_{40\%})$ is 2216.5 million eggs, which gives a catch of 756.9 mt. Equilibrium yield at the proxy F_{MSY} harvest rate corresponding to $SPR_{50\%}$ is 0 mt. 153

Table e: Summary of reference points and management quantities for the base case.

Research And Data Needs

research-and-data-needs

- Include: identify information gaps that seriously impede the stock assessment.
- 169 We recommend the following research be conducted before the next assessment:
- 1. List item No. 1 in the list
- 2. List item No. 2 in the list, etc.

72 Rebuilding Projections

rebuilding-projections

Include: reference to the principal results from rebuilding analysis if the stock is overfished.
This section should be included in the Final/SAFE version assessment document but is not required for draft assessments undergoing review. See Rebuilding Analysis terms of reference

for detailed information on rebuilding analysis requirements.

1 Introduction

introduction

1.1 Basic Information ■

basic-information

Pacific ocean perch (Sebastes alutus) are most abundant in the Gulf of Alaska, and have been 179 observed off of Japan, in the Bering Sea, and south to Baja California, although they are 180 sparse south of Oregon and rare in southern California. While genetic studies have found 181 three populations of Pacific ocean perch off of British Columbia (Seeb and Gunderson 1988, 182 Withler et al. 2001) with, notably, a separate stock off of Vancouver Island, no significant 183 genetic differences have been found in the range covered by this assessment. Pacific ocean 184 perch show dimorphic growth, with females reaching a slightly large size than males. Males 185 and females are equally abundant on rearing grounds at age 1.5. 186

The Pacific ocean perch population has been modeled as a single stock off of the U.S. West
Coast (essentially northern California to the Canadian border, since Pacific ocean perch are
seen extremely rarely in central and southern California). Good recruitments show up in
size-composition data throughout all portions of this area, which supports the single stock
hypothesis. This assessment includes landings and catch data for Pacific ocean perch from
the states of Washington, Oregon and California, along with records from foreign fisheries,
the at-sea hake fleet, and surveys.

Prior to 1966, the Pacific ocean perch resource off of the northern portion of the U.S. West 194 Coast was harvested almost entirely by Canadian and United States vessels. Harvest was 195 negligible prior to 1940, reached 1,300 mt in 1950, 3,200 mt in 1961 and exceeded 7,600 mt in 196 1965. Catches increased dramatically after 1965, with the introduction of large distant-water 197 fishing fleets from the Soviet Union and Japan. Both nations employed large factory stern trawlers as their primary method for harvesting Pacific ocean perch. Peak removals by all 199 foreign nations combined are estimated at over 15,000 mt in 1966 and remained over 12,000 mt 200 in 1967. These numbers are based upon a re-analysis of the foreign catch data (Rogers 2003), 201 which focused on deriving a more realistic species composition for catches previously identified 202 only as Pacific ocean perch. Catches declined rapidly following these peak years, and Pacific 203 ocean perch stocks were considered to be severely depleted throughout the Oregon-Vancouver Island region by 1969 (Gunderson 1977, Gunderson et al. 1977). Landed harvest averaged 205 1,350 mt over the period 1977-94. Landings have continued to decline since 1994, primarily 206 due to more restrictive management (Figure 2). 207

Prior to 1977, Pacific ocean perch in the northeast Pacific were managed by the Canadian Government in its waters and by the individual states in waters off of the United States. With implementation of the Magnuson Fishery Conservation and Management Act (MFCMA) in 1977, U.S. territorial waters were extended to 200 miles from shore, and primary responsibility for management of the groundfish stocks off Washington, Oregon and California shifted from the states to the Pacific Fishery Management Council (PFMC) and the National Marine Fisheries Service (NMFS). At that time, however, a Fishery Management Plan (FMP) for the

west coast groundfish stocks had not yet been approved. In the interim, the state agencies worked with the PFMC to address conservation issues. In 1981, the PFMC adopted a 216 management strategy to rebuild the depleted Pacific ocean perch stocks to levels that would 217 produce Maximum Sustainable Yield (MSY) within 20 years. On the basis of cohort analysis 218 (Gunderson 1978), the PFMC set Acceptable Biological Catch (ABC) levels at 600 mt for 219 the US portion of the Vancouver INPFC area and 950 mt for the Columbia INPFC area. To 220 implement this strategy, the states of Oregon and Washington each established landing limits 221 for Pacific ocean perch. Trawl trip limits of various forms remained in effect through 2010 222 (Table 1). 223

Age estimates for Pacific ocean perch prior to the 1980s were made via surface ageing of 224 otoliths, which misses the very tight annuli at the edge of the otolith once the fish reaches near 225 maximum size. Ages are biased by around age 10-12, and maximum age was estimated to be 226 in the 20s, which lead to an overestimate of the natural mortality rate and the productivity of the stock. Using break and burn methods, Pacific ocean perch have been aged to over 228 100 years, and we now know that the underlying assumptions of the early models were overly optimistic about productivity. Research surveys have been used to provide fishery-230 independent information about the abundance, distribution, and biological characteristics 231 of Pacific ocean perch. A coast-wide survey of the rockfish resource was conducted in 1977 232 (Gunderson and Sample 1980) and was repeated every three years through 2004 (referred to 233 as the 'Triennial Survey'). The National Marine Fisheries Service (NMFS) coordinated a 234 cooperative research survey of the Pacific ocean perch stocks off Washington and Oregon 235 with the Washington Department of Fisheries (WDFW) and the Oregon Department of 236 Fish and Wildlife (ODFW) in March-May 1979 (Wilkins and Golden 1983). This survey 237 was repeated in 1985 (referred to as the Pacific ocean perch Survey). Two slope surveys 238 have been conducted on the West Coast in recent years, one using the research vessel Miller 239 Freeman, which ended in 2001 (referred to as the 'AFSC Slope Survey'), and another ongoing 240 cooperative survey using commercial fishing vessels which began in 1998 as a DTS (Dover 241 sole, thornyhead and sablefish) survey, was expanded to other groundfish in 1999 (referred to 242 as the 'NWFSC Slope Survey'). In 2003, this survey was expanded spatially to include the 243 shelf. This last survey, conducted by the NWFSC, continues to cover depths from 30-700 fathoms (55-1280 meters) on an annual basis (referred to as the 'NWFSC shelf-slope Survey'). 245

1.2 Summary of Management History

summary-of-management-history

Include: Summary of management history (e.g., changes in mesh sizes, trip limits, or other management actions that may have significantly altered selection, catch rates, or discards).

Include: Management performance, including a table or tables comparing Overfishing Limit (OFL), Annual Catch Limit (ACL), Harvest Guideline (HG) [CPS only], landings, and catch (i.e., landings plus discard) for each area and year.

Management performance table: (Table f)

247

248

A summary of these values as well as other base case summary results can be found in Table i.

²⁵⁵ 1.3 Fisheries off Canada, Alaska, and/or Mexico

fisheries-off-canada-alaska-andor-mexico

Pacific ocean perch can be found in waters off the US west coast and northward through
Alaskan waters. The subset of the stock off the US west coast represents the tail of the
species distribution with little to no Pacific ocean perch being encountered south of northern
California. Pacific ocean perch are harvested both in Canada and Alaska. The most recent
updated assessments for the Bering Sea and the Gulf of Alaska stocks determined that neither
stock are in an overfished state and recommended and acceptable biological catch of 43,723
mt and 23,918 mt, respectively, for 2017.

In Canadian waters Pacific ocean perch has the largest single-species quota, accounting for approximately 25% of all rockfish landings by weight in the bottom trawl fleet. The Canadian Pacific ocean perch stock is broken into three seperate areas that are individually assessed. The status of the stock within each area are above Canadian management targets.

267 **Data**

data

Data used in the Pacific ocean perch assessment are summarized in Figure 1. A description of each data source is provided below.

2.1 Fishery-Independent Data:

fishery-independent-data

1 2.1.1 Northwest Fisheries Science Center (NWFSC) shelf-slope survey 1 northwest-fisheries-science-center-nwfsc-shelf-slope-survey

The NWFSC shelf-slope survey is based on a random-grid design; covering the coastal waters from a depth of 55 m to 1,280 m (Bradburn et al. 2011). This design uses four chartered industry vessels in most years, assigned to a roughly equal number of randomly selected grid cells. The survey, which has been conducted from late-May to early-October each year, is divided into two 2-vessel passes of the coast, which are executed from north to south. This design therefore incorporates both vessel-to-vessel differences in catchability as well as variance associated with selecting a relatively small number (~700) of cells from a very large population of possible cells (greater than 11,000) distributed from the Mexican to the Canadian border.

The data from the NWFSC shelf-slope survey was analyzed using a spatial delta-generalized linear mixed model (delta-GLMM) (Thorson and Barnett 2017). Predicted fish biomass density is derived as the product of a "delta" portion for the probability of a non-zero catch and a second portion for the magnitude of the non-zero catches. Further, the geostatistical GLMM framework can accommodate spatial autocorrelation. Additional information about the approach and the software package it is implemented in are available from www.fishstats.org. describe VAST

The estimated index of abundance is shown in Table 18.

239 2.1.2 Northwest Fisheries Science Center (NWFSC) slope survey northwest-fisheries-science-center-nwfsc-slope-survey

The NWFSC slope survey covered waters throughout the summer from 183 m to 1280 m north of 34°30′ S, which is near Point Conception. The survey strata used to expand the biomass data for this assessment are shown in Table 5.

The estimated index of abundance is shown in Table 18.

2.1.3 Alaska Fisheries Science Center (AFSC) slope survey alaska-fisheries-science-center-afsc-slope-survey

The AFSC slope survey operated during autumn (October-November) aboard the R/V Miller Freeman. Partial survey coverage of the U.S. west coast occurred during 1988-96 and complete coverage (north of 34°30′S) during 1997, 1999, 2000, and 2001. Only the four years of consistent and complete surveys plus 1996, which surveyed north of 43°N latitude to the U.S.-Canada border, were used in this assessment. The number of tows with length data ranged from 19 in 2000 to 48 in 1996 8. Because a large number of positive tows occurred in 1996, it was decided to include that year, which surveyed from 43°N latitude to the U.S.-Canada border. Therefore, only tows from 43°N latitude to the U.S.-Canada border were used.

The estimated index of abundance is shown in Table 18.

5 2.1.4 Triennial Bottom Trawl Survey

triennial-bottom-trawl-survey

The triennial survey was first conducted by the AFSC in 1977 and spanned the time-frame from 1977-2004. The survey's design and sampling methods are most recently described in (Weinberg et al. 2002). Its basic design was a series of equally-spaced transects from which searches for tows in a specific depth range were initiated (Figure 5). The survey design has changed slightly over the period of time (Table 4, Figure 3). In general, all of the surveys were conducted in the mid-summer through early fall: the 1977 survey was conducted from

early July through late September; the surveys from 1980 through 1989 ran from mid-July to late September; the 1992 survey spanned from mid-July through early October; the 1995 survey was conducted from early June to late August; the 1998 survey ran from early June through early August; and the 2001 and 2004 surveys were conducted in May-July (Figure 4).

Haul depths ranged from 91-457 m during the 1977 survey with no hauls shallower than 91 m.
The surveys in 1980, 1983, and 1986 covered the West Coast south to 36.8° N latitude and a
depth range of 55-366 meters. The surveys in 1989 and 1992 covered the same depth range
but extended the southern range to 34.5° N (near Point Conception). From 1995 through
2004, the surveys covered the depth range 55-500 meters and surveyed south to 34.5° N. In
the final year of the triennial series (2004), the NWFSC's Fishery Resource and Monitoring
division (FRAM) conducted the survey and followed very similar protocols as the AFSC.

Given the different depths surveyed during 1977, the data from that year were not included in this assessment. Water hauls (Zimmermann et al. 2003) and tows located in Canadian waters were also excluded from the analysis of this survey. The survey was analyzed as an early series (1980-1992) and a late series (1995-2004), as has been done in other West Coast rockfish assessments.

Describe whether the time-series was split or retained as one index

The estimated index of abundance is shown in Table 18.

330 2.1.5 Pacific ocean perch Survey

pacific-ocean-perch-survey

A survey targeted designed to sample Pacific ocean perch was conducted in 1979 and again in 1985. The estimated index of abundance is shown in Table 18.

333 2.2 Fishery-Dependent Data

fishery-dependent-data

³⁴ 2.2.1 Commercial Fishery Landings

commercial-fishery-landings

335 Washington

Historical commercial fishery landigns of Pacific ocean perch from Washington for the years
1918-2016 were obtained from Theresa Tsou (WDFW) and Phillip Weyland (WDFW). This
assessment is the first Pacific ocean perch assessment to include a state provide historical
catch reconstruction and hence, the historical catches for Washington vary markedly from
those used in the 2011 assessment. Due to Recent landings (1981-2016) were obtained directly
from Washington state rather than from PacFIN (Pacific Fisheries Information Network

³⁴² (PacFIN) due to identified missing catches not available within PacFIN for Pacific ocean perch.

344 Oregon

Historical commercial fishery landings of Pacific ocean perch from Oregon for the years 1892-1986 were obtained from Alison Dauble (ODFW). A description of the methods can be found in Karnowski et al. (2014). Recent landings (1987-2016) were obtained from PacFIN retrieval dated March 3, 2015, Pacific States Marine Fisheries Commission, Portland, Oregon; www.psmfc.org). The catch data in from the POP and POP2 categories contained within PacFIN for Pacific ocean perch were used for this assessment. Additional cathes from 1987-1999 for Pacific ocean perch under the UROCK category not yet available in PacFIN were received directly from the state and combined with the catch data available for that period within PacFIN.

354 California

Historical commercial fishery landings of Pacific ocean perch were obtained from the online database of the California Cooperative Groundfish Survey, also known as CALCOM
(128.114.3.187) for the years 1916-1980. A description of the methods can be found in (Ralston
et al. 2010). Recent landings (1981-2016) were obtained from PacFIN (Pacific Fisheries
Information Network (PacFIN) retrieval dated March 3, 2015, Pacific States Marine Fisheries
Commission, Portland, Oregon; www.psmfc.org).

361 At-Sea Hake Fishery

Catches of Pacific ocean perch are monitored aboard the vessel by observers in the At-Sea 362 hake Observer program (ASHOP) and were available for the years of 1975-2016. Observers 363 use a spatial sample design, based on weight, to randomly choose a portion of the haul to 364 sample for species composition. For the last decade, this is typically 30-50\% of the total 365 weight. The total weight of the sample is determined by all catch passing over a flow scale. 366 All species other than hake are removed and weighed, by species, on a motion compensated 367 flatbed scale. Observers record the weights of all non-hake species. Non-hake species total 368 weights are expanded in the database by using the proportion of the haul sampled to the 369 total weight of the haul. The catches of non-hake species in unsampled hauls is determined 370 using bycatch rates determined from sampled hauls. Since 2001, more than 97% of the hauls 371 have been observed and sampled. 372

373 Foreign Catches

From the 1960s through the early 1970s, foreign trawling enterprises harvested considerable amounts of rockfish off Washington and Oregon, and along with the domestic trawling fleet, landed large quantities of Pacific ocean perch. Foreign catches of individual species were estimated by Rogers (2003) and attributed to INPFC areas for the years of 1966-1976 for Pacific ocean perch. The foreign catches were combined across areas for a coastwide removal total.

 $_{
m 3800}$ 2.2.2 ${
m Discards}$ discards

Data on discards of Pacific ocean perch are available from two different data sources. The earliest source is called the Pikitch data and comes from a study organized by Ellen Pikitch 382 that collected trawl discards from 1985-1987 (Pikitch et al. 1988). The northern and southern 383 boundaries of the study were 48°42′ N latitude and 42°60′ N. latitude respectively, which is primarily within the Columbia INPFC area (Pikitch et al. 1988, Rogers and Pikitch 1992). 385 Participation in the study was voluntary and included vessels using bottom, midwater, and 386 shrimp trawl gears. Observers of normal fishing operations on commercial vessels collected 387 the data, estimated the total weight of the catch by tow and recorded the weight of species retained and discarded in the sample. Results of the Pikitch data were obtained from John 380 Wallace (NWFSC, personal communication) in the form of ratios of discard weight to retained weight of Pacific ocean perch and sex-specific length frequencies. Discard estimates are shown 391 in Table 3.

The second source is from the West Coast Groundfish Observer Program (WCGOP). This program is part of the NWFSC and has been recording discard observations since 2003. 394 Table 3 shows the discard ratios of Pacific ocean perch from the WCGOP. Since 2011, when 395 the trawl rationalization program was implemented, observer coverage rates increased to 396 nearly 100% for all the limited entry trawl vessels in the program and discard rates declined 397 compared to pre-2011 rates. Discard rates were obtained for both the catch-share and the 398 non-catch share sector for Pacific ocean perch. A single discard rate was calculated by 390 weighting discard rates based on the commercial landings by each sector. Discard length 400 composition for the trawl fleet varied by year, with larger fish being discarded prior to 2011 401 (Figure ??).

2.2.3 Historical Commercial Catch-per-unit effort

historical-commercial-catch-per-unit-effort

Data on catch-per-unit-effort (CPUE) in mt/hr from the domestic fishery were combined for the INPFC Vancouver and Columbia areas (Table 17 from Gunderson (1977)). Although these data reflect catch rates for the US fleet, the highest catch rates coincided with the beginning of removals by the foreign fleet. This suggest that, barring unaccounted changes in fishing efficiency during this period, the level of abundance was high at that time. A CV of 0.40 was used in this assessment to be consistent with the CV observed in the survey data.

110 2.2.4 Fishery Length And Age Data

fishery-length-and-age-data

411 2.3 Biological Data

biological-data

412 2.3.1 Natural mortality

natural-mortality

Historic Pacific ocean perch ages determined using scales and surface reading methods of 413 otoliths, resulted in estimates of natural mortality of between 0.10 and 0.20yr⁻¹ with a longevity 414 less than 30 years (Gunderson 1977). Based on break-and-burn method of age determination 415 using otoliths, the maximum age of Pacific ocean perch was revised to be 90 years (Chilton 416 and Beamish 1982). The updated understanding concerning Pacific ocean perch longevity 417 reduced the estimate of natural mortality based on Hoenig's (1983) relationship to 0.059yr⁻¹. 418 The previous assessment applied a prior distribution on natural mortality based upon multiple 419 life history correlates (including Hoenig's method, Gunderson gonadosomatic index (1997), 420 and McCoy and Gillooly's (2008) theoretical relationship) developed separately for female and 421 male Pacific ocean perch. This assessment also applied a prior on natural mortality. However, 422 the prior and standard deviation were generated as a non-linear function of maximum age as 423 developed by Then et al. (2015) and modified by Owen Hamel which greatly improved the 424 fit to the underlying age data to create the 'Hamel-Then' prior. A maximum age of 100 was used in the development of the prior where female natural memorability was set equal to 426 0.054 and male natural mortality estimated as an offset from females at 0.053.

$_{28}$ 2.3.2 Sex ratio, maturation, and fecundity

sex-ratio-maturation-and-fecundity

Examining all biological data sources, the sex ratio of young fish are within 5% of 1:1 by either 429 length or age (Figure 3 and 4), and hence this assessment the sex ratio at birth was assumed 430 to be 1:1. This assessment assumed a logistic maturity-at-length curve based on analysis of 431 537 fish maturity samples collected from the NWFSC shelf-slope survey. This is revised from 432 the previous assessment which assumed maturity-at-age based on the work of Hannah and 433 Parker (Hannah and Parker 2007). Additionally, the new maturity-at-length curve is based 434 on the estimate of functional maturity an approach that classifies rockfish maturity with 435 developing oocytes as mature or immature based on the proportion of vitellogenin in the 436 cytoplasm and the measured frequency of atretic cells (M. Head, personal communication). 437 The 50% size-at-maturity was estimated at 32.1 cm with maturity asymptoting to one for larger fish. 430

The fecundity-at-age has also been updated from the previous assessment based on new research. Dick (2017) estimated new fecundity relationships for select West Coast stocks where fecundity for Pacific ocean perch was estimated equal to $0L^{4.98}$ in millions of eggs. Spawning output at length is shown in Figure 7.

444 2.3.3 Length-weight relationship

length-weight-relationship

The length-weight relationship for Pacific ocean perch was estimated outside the model using all biological data available from fishery and fishery-independent data sources where the female weight-at-length in grams was estimated at $0.0000098L^{3.11}$ and males at $0.0000094L^{3.12}$ where L is length in cm (Figures 19 and 20).

2.3.4 Growth (length-at-age)

growth-length-at-age

The length-at-age was estimated for male and female Pacific ocean perch using data collected from both fishery-dependent and -independent data sources that were collected from 19812016. Figure 21 shows the lengths and ages for all years and all data as well as predicted von Bertalanffy fits to the data. Females grow larger than males and sex specific growth parameters were estimated at the following values:

```
Females L_{\infty} = 42.32; k = 0.169; t_0 = -1.466
```

456 Males $L_{\infty} = 39.03$; k = 0.212; $t_0 = -1.02$

457 2.3.5 Ageing Precision And Bias

ageing-precision-and-bias

Uncertainty surrounding the ageing-error process for Pacific ocean perch was incorporated by 458 estimating ageing error by age. Age-composition data used in the model were from break-459 and-burn otolith reads aged by the Cooperative Ageing Project (CAP) in Newport, Oregon. 460 Break-and-burn double reads of more than 1500 otoliths were provided by the CAP lab. An 461 ageing error estimate was made based on these double reads using a computational tool 462 specifically developed for estimating ageing error (Punt et al. 2008), and using release 1.0.0 of the R package nwfscAgeingError (Thorson et al. 2012) for input and output diagnostics, 464 publicly available at: https://github.com/nwfsc-assess/nwfscAgeingError. A non-linear standard error was estimated by age where there is more variability in the estimated age of 466 older fish was estimated (Table 19, Figure 22). 467

468 2.4 History Of Modeling Approaches Used For This Stock

history-of-modeling-approaches-used-for-this-stock

$_{69}$ 2.4.1 Previous Assessments

previous-assessments

2.4.2 Previous Assessment Recommendations

previous-assessment-recommendations

Include: Response to STAR panel recommendations from the most recent previous assessment.

- Considering transboundary stock effects should be pursued. In particular the consequences of having spawning contributions from external stock components should be evaluated relative to the steepness estimates obtained in the present assessment (see more complete discussion of this recommendation under the Unresolved Problems and Major Uncertainties section, above).
- STAT response: The STAT team agrees that this should be an ongoing area of research and collaboration between the US and Canada. This assessment presents a sensitivity where the inclusion of Canadian data are included within the model.
- The benefits of adopting the complex model used this year should be evaluated relative to simpler assumptions and models. While the transition from the simpler old model to Stock Synthesis was shown to be similar for the historical period, the depletion estimates in the most recent years were different enough to warrant further investigation.
- 484 STAT response: blah blah blah....
- Discard estimates from observer programs should be presented, reviewed (similar to the catch reconstructions), and be made available to the assessment process.
- 487 STAT response: blah blah blah....
- The ability to allow different "plus groups" for specific data types should be evaluated (and implemented in Stock Synthesis). For example, this would provide the ability to use the biased surface-aged data in an appropriate way.
- 491 STAT response: blah blah blah....
- Historical catch reconstruction estimates should be formally reviewed prior to being used in assessments and should be coordinated so that interactions between stocks are appropriately treated. The relative reliability of the catch estimates over time could provide an axis of uncertainty in future assessments.
- 496 STAT response: blah blah blah....

497 3 Assessment

assessment

498 3.1 Model Description

model-description

499 3.1.1 Transition To The Current Stock Assessment transition-to-the-current-stock-assessment

[∞] Include: Complete description of any new modeling approaches

- Below, we describe the most important changes made since the last full assessment and explain rationale for each change.:
- 1. Change No. 1. Rationale: blah blah blah.
- 2. Change No. 2. Rationale: blah blah blah.
- 3. Change No. 3. Rationale: Continue list as needed.

506 3.1.2 Definition of Fleets and Areas

definition-of-fleets-and-areas

- We generated data sources for each of the models. Fleets by model include:
- 508 Commercial: The commercial fleets include...
- Recreational: The recreational fleets include...
- ⁵¹⁰ Research: Research derived-data include...

3.1.3 Summary of Data for Fleets and Areas

summary-of-data-for-fleets-and-areas

512 3.1.4 Modeling Software

modeling-software

- The STAT team used Stock Synthesis version 3.30.01.13 by Dr. Richard Methot at the NWFSC (Methot and Wetzel 2013). This most recent version was used, since it included improvements and corrections to older versions.
- 516 3.1.5 Data Weighting

data-weighting

- 517 Citation for Francis method (Francis and Hilborn 2011)
- 518 Citation for Ianelli-McAllister harmonic mean method (McAllister and Ianelli 1997)

519 **3.1.6** Priors

priors

520 Citation for Hamel prior on natural mortality (Hamel 2015)

21 3.1.7 General Model Specifications

general-model-specifications

- 522 Citation for posterior predictive fecundity relationship from Dick (2009) and (2017)
- Model data, control, starter, and forecast files can be found in Appendices A-D.

524 3.1.8 Estimated And Fixed Parameters

estimated-and-fixed-parameters

A full list of all estimated and fixed parameters is provided in Tables.... Estimated and fixed parameters tables currently read in from .csv file, EXAMPLE: Table ??

₅₂₇ 3.2 Model Selection and Evaluation

model-selection-and-evaluation

528 3.2.1 Key Assumptions and Structural Choices

key-assumptions-and-structural-choices

- Include: Evidence of search for balance between model realism and parsimony.
- Comparison of key model assumptions, include comparisons based on nested models (e.g.,
- asymptotic vs. domed selectivities, constant vs. time-varying selectivities).

3.2.2 Alternate Models Considered

alternate-models-considered

533 Include: Summary of alternate model configurations that were tried but rejected.

534 3.2.3 Convergence

convergence

- Include: Randomization run results or other evidence of search for global best estimates.
- Convergence testing through use of dispersed starting values often requires extreme values to
- actually explore new areas of the multivariate likelihood surface. Jitter is a SS option that
- 538 generates random starting values from a normal distribution logistically transformed into
- each parameter's range (Methot and Wetzel 2013). Table 23 shows the results of running 100
- jitters for each pre-STAR base model....

3.3 Response To The Current STAR Panel Requests

response-to-the-current-star-panel-requests

Request No. 1: Add after STAR panel.

543

544

Rationale: Add after STAR panel.

STAT Response: Add after STAR panel.

⁵⁴⁶ Request No. 2: Add after STAR panel.

547

Rationale: Add after STAR panel.

549 STAT Response: Add after STAR panel.

550 Request No. 3: Add after STAR panel.

578 5 Regional Management Considerations

regional-management-considerations

- 1. For stocks where current practice is to allocate harvests by management area, a recommended method of allocating harvests based on the distribution of biomass should be provided. The MT advisor should be consulted on the appropriate management areas for each stock.
- 2. Discuss whether a regional management approach makes sense for the species from a biological perspective.
 - 3. If there are insufficient data to analyze a regional management approach, what are the research and data needs to answer this question?

587 6 Research Needs

research-needs

- 1. Research need No. 1

tables

Table 1: West Coast history of regulations.

tab:Regs Date Regulation Area 11/10/1983 Columbia Closed Columbia area to Pacific ocean perch fishing until the end of the year, as 950 mt OY for this species has been reached; 11/10/1983 Vancouver retained 5,000-pound trip limit or 10% of total trip weight on landings of Pacific ocean perch in the Vancouver area. 1/1/1984 ALL Continued 5,000-pound trip limit or 10% of total trip weight on Pacific ocean perch as specified in FMP. Fishery to close when area OYs are reached (see action effective November 10, 1983 above). 8/1/1984 Vancouver Reduced trip limit for Pacific ocean perch in the Vancouver and Columbia areas to 20% by weight of all fish on board, not to exceed 5,000 pounds Columbia per vessel per trip. 8/16/1984 Columbia Commercial fishing for Pacific ocean perch in the Columbia area closed for remainder of the year. 1/10/1985 Vancouver Established Vancouver and Columbia areas Pacific ocean perch trip limit Columbia of 20% by weight of all fish on board (no 5,000-pound limit as specified in last half of 1984). Reduced the Vancouver and Columbia areas Pacific ocean perch trip limit 4/28/1985 Vancouver Columbia to 5,000 pounds or 20% by weight of all fish on board, whichever is less. 4/28/1985 ALLLandings of Pacific ocean perch less than 1,000 pounds will be unrestricted. The fishery for this species will close when the OY in each area is reached. 6/10/1985 ALL Landings of Pacific ocean perch up to 1,000 pounds per trip will be unrestricted regardless of the percentage of these fish on board. 1/1/1986 Cape Blanco Established the Pacific ocean perch trip limit north of Cape Blanco (4250) North at 20% (by weight) of all fish on board or 10,000 pounds whichever is less; 1/1/1986 ALL landings of Pacific ocean perch unrestricted if less than 1,000 pounds regardless of percentage on board; Vancouver area OY = 600 mt; Columbia area OY = 950 mt.12/1/1986 Vancouver OY quota for Pacific ocean perch reached in the Vancouver area; fishery closed until January 1, 1987. ALL 1/1/1987 Established coastwide Pacific ocean perch limit at 20% of all legal fish on board or 5,000 pounds whichever is less (in round weight); landings of Pacific ocean perch unrestricted if less than 1,000 pounds regardless of percentage on board; Vancouver area OY =500 mt; Columbia area OY = 800 mt. 1/1/1988 ALL Established the coastwide Pacific ocean perch trip limit at 20% (by weight) of all fish on board or 5,000 pounds, whichever is less; landings of Pacific ocean perch unrestricted if less than 1,000 pounds regardless of percentage on board; ALL Established the coastwide Pacific ocean perch trip limit at 20% (by 1/1/1989 weight) of all fish on board or 5,000 pounds whichever is less; 1/1/1989 ALL landings of Pacific ocean perch unrestricted if less than 1,000 pounds regardless of percentage on board (Vancouver area OY =500 mt; Columbia area OY =800 mt). 7/26/1989 ALL Reduced the coastwide trip limit for Pacific ocean perch to 2,000 pounds or 20% of all fish on board, whichever is less, with no trip frequency restriction. Columbia Closed the Pacific ocean perch fishery in the Columbia area because 1,040 12/13/1989 mt OY reached. 1/1/1990 ALL Established the coastwide Pacific ocean perch trip limit at 20% (by weight) of all fish on board or 3,000 pounds whichever is less; landings of Pacific ocean perch be unrestricted if less than 1,000 pounds regardless of percentage on board. (Vancouver area OY = 500 mt; Columbia area OY = 1,040 mt). 1/1/1991 ALLEstablished the coastwide Pacific ocean perch trip limit at 20% (by weight) of all groundfish on board or 3,000 pounds whichever is less; landings of Pacific ocean perch be unrestricted if less than 1,000 pounds regardless of percentage on board (harvest guideline for combined Vancouver and Columbia areas = 1,000 mt). 1/1/1992 ALL For Pacific ocean perch, established the coastwide trip limit at 20% (by weight) of all groundfish on board or 3,000 pounds whichever is less; landings of Pacific ocean perch be unrestricted if less than 1,000 pounds regardless of percentage on board (harvest guideline for combined Vancouver and Columbia areas = 1,550 mt).

| Date | Area | Regulation | | | |
|--|--|--|--|--|--|
| 1/1/1993 | Cape | For Pacific ocean perch, continued the coastwide trip limit at 20% (by | | | |
| | Mendocino | weight) of all groundfish on board or 3,000 pounds whichever is less; | | | |
| | Coos Bay | landings of Pacific ocean perch unrestricted if less than 1,000 pounds | | | |
| | | regardless of percentage on board (harvest guideline for combined | | | |
| 1 /1 /1004 | АТТ | Vancouver and Columbia areas = 1,550 mt). | | | |
| 1/1/1994 | ALL | Pacific Ocean Perch trip limit of 3,000 pounds or 20% of all fish on board | | | |
| 1 /1 /1005 | A T T | whichever is less, in landings of Pacific ocean perch above 1,000 pounds. | | | |
| 1/1/1995 | ALL | For Pacific Ocean Perch, established a cumulative trip limit of 6,000 pounds | | | |
| 1 /1 /1000 | A T T | per month | | | |
| 1/1/1996 | ALL | Pacific Ocean Perch cumulative trip limit of 10,000 pounds per two-month | | | |
| 7 /1 /1000 | 4090 N 41 | period. | | | |
| 7/1/1996 | 4030 North | Reduced the cumulative 2-month limit for Pacific ocean perch to 8,000 | | | |
| | | pounds, and established the cumulative 2-month limit for Dover sole north | | | |
| 1 /1 /1007 | ALL | of Cape Mendocino at 38,000 pounds | | | |
| 1/1/1997 | ALL | Pacific Ocean Perch limited entry fishery cumulative trip limit of 8,000 | | | |
| 1 /1 /1000 | АТТ | pounds per two-month period | | | |
| 1/1/1998 | ALL | Pacific Ocean Perch: limited entry fishery Cumulative trip limit of 8,000 | | | |
| 7 /1 /1000 | АТТ | pounds per two-month period. | | | |
| 7/1/1998 | ALL | Open Access Rockfish: removed overall rockfish monthly limit and replaced | | | |
| | | it with limits for component rockfish species: for Sebastes complex, | | | |
| | | monthly cumulative limit is 33,000 pounds, for widow rockfish, monthly | | | |
| | | cumulative trip limit is 3,000 pounds, for Pacific Ocean Perch, monthly | | | |
| 1/1/1999 | ALL | cumulative trip limit is 4,000 pounds. for the limited entry fishery A new three phase cumulative limit period | | | |
| 1/1/1999 | ALL | system is introduced for 1999. Phase 1 is a single cumulative limit period | | | |
| | | | | | |
| | | that is 3months long, from January 1 - March 31. Phase 2 has 3 separate 2 | | | |
| | | month cumulative limit periods of April 1 - May 31, June 1 - July 31, and | | | |
| | | August 1 - September 30. Phase 3 has 3 separate 1 month cumulative limi | | | |
| | | periods of October 1-31, November 1-30, and December 1-31. For all | | | |
| | | species except Pacific ocean perch and Bocaccio, there will be no monthly | | | |
| | | limit within the cumulative landings limit periods. An option to apply | | | |
| | | cumulative trip limits lagged by 2 weeks (from the 16th to the 15th) was | | | |
| | | made available to limited entry trawl vessels when their permits were | | | |
| | | renewed for 1999. Vessels that are authorized to operate in this "B" | | | |
| | | platoon may take and retain, but may not land, groundfish during January 1-15, 1999. | | | |
